²N.A.Semashko National Research Institute of Public Health of the Russian Academy of Medical Sciences Moscow, Russia

Abstract: To assess the level of development of pharmacoeconomics in the Russian Federation as a branch of science analysis of pharmacoeconomic and clinical economic studies published in the scientific electronic library "eLIBRARY.RU" (RSCI) for the period from 2005 through 2015 was performed.

As a result, it was determined that the number of such studies from year to year is steadily increasing. The leader among the countries who publish their researches on the platform of the scientific electronic library "eLIBRARY.RU" was Russia, the second and the third places were shared by Ukraine and Belarus, respectively. The research was carried out in 52 subjects of the Russian Federation, which is represented by 63 Universities. Leader out of them was the I.M. Sechenov First Moscow State Medical University. It turned out that most pharmacoeconomic and clinical-economic research during the specified time interval was devoted to cardiovascular, pulmonary, oncological and endocrinological diseases. As a result of analysis, it was found that among pharmacoeconomic research methods most commonly used "cost-effectiveness" analysis (45,1%). In addition, on the basis of the analyzed data of Russian science citation index and the total number of published works, the rating of the authors who conducted research in the field of pharmacoeconomics in the country.

Key words: pharmacoeconomic studies, clinical economic studies, methods of pharmacoeconomic studies, pharmacoeconomics, ranking of authors, ranking of universities, ranking methods of pharmacoeconomic analysis, pharmacoeconomic analysis, ranking of universities, ranking in medical, scientific electronic library, eLIBRARY.RU, RISC.

Introduction

Pharmacoeconomic and clinical-economic studies of medical technologies, drugs, medical devices and surgical interventions are crucial in connection with what is happening healthcare modernization in the Russian Federation, involving the continuous introduction of innovative technologies in the diagnosis, prevention and treatment of various diseases.

The use of pharmacoeconomic and clinical-economic research in public health practice, in the sphere of circulation of medicines, in the course of scientific research is laid down in the Government Decree No. 871 dated 28.09.2014 g. "On approval of Rules of forming of lists of medicinal preparations for medical application and the minimum assortment of medicinal preparations necessary for rendering medical care." In this legal act is stated that pharmacoeconomic assessment is a mandatory part of the process of deciding whether a medicinal product on the lists. When carrying out domestic pharmacoeconomic and clinical-economic research should take into account the cost structure, the level of development of the health system, features of real clinical practice in the Russian Federation.

Therefore, today, it is important to review published research on pharmacoeconomic and clinical-economic analysis. In addition, during the information search revealed that there is no published analysis reflecting the actual

status of pharmacoeconomic and clinical-economic research, but there are databases that allow you to do so. The largest platform for searching research data was scientific electronic library "eLIBRARY.RU" where such materials are presented in full and are freely available for interested readers.

Materials and methods

"eLIBRARY.RU" is Russia's largest internet library of scientific publications, with rich search capabilities and the timely receipt of necessary information. Library is integrated with the Russian scientific citation index (RSCI), established by order of Ministry of education and science of the Russian Federation in 2005, which is a widely available tool for measurement and analysis of publication activity of organizations in general and scientists in particular [1].

A search of published studies was carried out during the period from 2005 to 2015 a period of time was chosen. It is the last ten years are most relevant in evaluating the level of development of pharmacoeconomic and clinical-economic research in the Russian Federation. This is due to the implementation of several state programmes in the system of a preferential provision of medicines (for example, "7 high-cost nosologies"), the introduction of a new order of formation of the list of vital and essential drugs (EDL), as well as the adoption of legislation on rare diseases and orphan drugs.

Search research papers on Russian and foreign pharmacoeconomic and clinical-economic research was carried out as at 01.09.2016 on the words "pharmacoeconomic*", "clinical and econom*" with the appropriate endings. Type of publications set in the parameters of the search system of the scientific electronic library "eLIBRARY.RU" included books, articles in journals and conference proceedings. The criteria for inclusion in this analysis were general accessibility and availability of full text scientific material on the portal.

This format was chosen due to the fact that scientific work is open access have a relatively large readership that logically indicates a higher rate of citations of the authors than with the publication of the works by any other method [2].

Results

I. Data analysis of pharmacoeconomic and clinical-economic research, published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015.

As a result of information search during the period from 2005 to 2015 on the platform of the scientific electronic library "eLIBRARY.RU" it was found and analysed 1425 publicly available and having the full text of scientific sources [6-1430], which accounted for about 60% of all researches. At the same time, the full text was available, 76% of published works. The analysis revealed that the largest part of the research materials (or 82.7%) were represented by articles from the magazines, the much smaller proportion (17.3 per cent) belonged to the abstracts in conferences, symposia and congresses.

With the aim of providing concrete data that clearly illustrate the situation with the Russian scientific, pharmacoeconomic and clinical-economic writings to date, all studies were classified according to the following pa-

rameters: geographical (global and national scale), temporary, local, and nosological.

II. The distribution of the pharmacoeconomic and clinical-economic research and geographic setting on a global scale

Despite the fact that pharmacoeconomic and clinical-economic research in Europe and the United States began much earlier than in the Russian Federation, few foreign authors publish their messages on the platform of the scientific electronic library "eLIBRARY.RU". However, in the framework of this analysis on the portal "eLIBRARY.RU" publications of scientists from 12 countries with the highest priority in Russia - 88,1%, followed by Ukraine - 5,7%, and Belarus - 2,7%, and the rest of the country accounts for a smaller percentage of the work, which amounts to 3.1%, which is illustrated in the figure (Fig.1).

of the Russian Federation has not overcome the turn of 2.5%, information about ongoing research in these regions are presented in the table (Fig. 2).

IV. Distribution of the pharmacoeconomic and clinical-economic studies according to a time parameter

Assessing the dynamics of publications in the period from 2005 to 2015, we can say that the number of pharmacoeconomic and clinical-economic research in the Russian Federation on the increase since 2005 and every year to increase, reaching a peak in 2011 (Fig.3).

V. Distribution of the pharmacoeconomic and clinical-economic research on local option

On the basis of the scientific electronic library "eLIBRARY.RU" their pharmacoeconomic and clinical-economic study published as a research centers and medical institutions. The vast majority (86.3 per cent) are 63 universities

Fig. 1. The distribution of the pharmacoeconomic and clinical economic studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015, geographical setting in the world.

III. The distribution of the pharmacoeconomic and clinical economic studies on the geographical setting on subjects in the scale of the Russian Federation

According to the scientific electronic library "eLIBRARY.RU" for the last ten years, pharmacoeconomic and clinical-economic studies were carried out in 52 subjects of the Russian Federation. The greatest number of them came from research conducted in Moscow - 45,2%, in the second place Saint Petersburg - 11.3%, and closes the three leaders of Nizhny Novgorod at 2.6%. Other subjects

in the Russian Federation. In identifying this trend was the rating of educational institutions, conducting of pharmacoeconomic and clinical-economic research. It was assessed that I.M. Sechenov First Moscow State Medical University was unequivocal leader (Moscow, 26,4% of performed studies), Pirogov Russian National Research Medical University was at the second place (Moscow, 7,9% of studies), Saint Petersburg State University was at the third place (Saint Petersburg 4,3% of studies).

Fig. 3. Dynamics of the number of pharmacoeconomic and clinical economic studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015.

N ^o	Region	%	N ^o	Region	%

Fig. 2. The distribution of the pharmacoEconomic and clinical economic studies published on the basis of the scientific electronic library «eLIBRARY.RU» from 2005 to 2015, on subjects of the Russian Federation.

In other Universities of the Russian Federation are also pharmacoEconomic and clinical-economic research, but the share of each of them reaches 3%, as shown in table (Fig. 4).

VI. The distribution of the pharmacoEconomic and clinical-economic research according to nosological parameter

As mentioned above, all the analyzed studies were also classified according to nosological principle. The leading destinations included cardiovascular, pulmonary, oncological and endocrinological diseases. A certain number of works (7.4 percent) was devoted to the study of public health issues, data on other nosological units is presented below (Fig. 5).

VII. Analysis of the data of the Russian index of scientific citation

The next stage of work consisted in the analysis of the data of the Russian index of scientific citing (RISC) is a bibliographic database of scientific publications of Russian scientists, simultaneously, the RISC is the realization of scientometric method changes the effectiveness of research activities [3]. Of course, worldwide, the rate of citation of the publication tells about its relevance, quality, fundamental provisions and conclusions of the conducted research.

In the result of the analysis revealed 64.8% published pharmacoEconomic and clinical-economic research, which has never been cited in any scientific papers. The number of publications with number of citations 1 to 4 is 29.2%, from 5 to 9 3.8%, the number of scientific publications, which were cited 10 or more times only 2.3%.

VIII. Ratings of the authors of pharmacoEconomic and clinical economic studies published on the basis of the scientific electronic library “eLIBRARY.RU” from 2005 to 2015.

Fig. 5. The distribution of the pharmacoEconomic and clinical economic studies published on the basis of the scientific electronic library “eLIBRARY.RU” from 2005 to 2015, according to nosological units.

Fig. 4. The distribution of the pharmacoeconomic and clinical economic studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015, the universities carried out these works.

In the framework of the analysis highlighted the authors whose works are most RISC with leading positions in the number of publications. According to the portal "eLIBRARY.RU" 01.09.2016., number of authors who have published their research in pharmacoeconomic and clinical-economic research, amounted to more than two thousand people.

It is important to note that this rating took into account only the researchers whose work has been cited 5 or more times. Each author was counted the

total number of citations found in publications based on data from the RISC and also specified the h-index. It is necessary to say that 25.4% of researchers data on h-index.

Thus, it is composed of two objective ranking of the authors of scientific research in pharmacoeconomic and clinical-economic analysis: a scientometric number of citations (Fig.7), and screening the number of published studies (Fig. 8).

Fig. 6. The distribution of the pharmacoeconomic and clinical-economic research on the results of counting RISC published studies for the period 2005 -2015. on the basis of the scientific electronic library «eLIBRARY.RU».

Fig. 8. Distribution of authors by number of studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015 (with h-index)

Analyzing the rankings of authors by the number of published studies over the period from 2005 to 2015, and the number of citations of these works, we can say that leaders in this matter were members of the I.M. Sechenov First Moscow State Medical University.

In addition, he compiled a ranking of authors based on their publication activity over the last three years of our study, namely from 2013 to 2015 were chosen by the authors, the number of publications amounted to more than 10, then assessment studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2013 to 2015. The championship remained the same authors, but they also found that the part of the authors, occupying a good position in the ranking for ten years, ceased to actively publish their research in the period from 2013 to 2015 that are presented in the table (Fig.9).

IX. Analysis of methods of pharmacoeconomic analysis used in studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015.

The next step was to identify the most frequently used method of pharmacoeconomic analysis by the authors in their scientific works. At this stage of work it was revealed that among all published studies that use methods of pharmacoeconomic analysis, the method of "cost-effectiveness" is the most popular and used at 45.1%. A special case of this method, is the method of "cost-utility", which was used in 6.9% of the studies.

Cost-of-illness analysis is the second most popular. For pharmacoeconomic and clinical-economic research, this method was used in 9.9% of cases. This is one of the basic methods of pharmacoeconomic analysis and at the same time a tool for the rational allocation of the limited budget of the Russian health care [4].

The three leaders completes the method of minimizing the costs of the

study which was carried out in 7.7%. The method of cost minimization is a special case of analysis of "cost-effectiveness" is used in the case when the effectiveness of two or more medical technologies are almost identical, and they differ only in value.

Budget impact analysis was applied at 4.3% of studies that is unreasonably small for this method. Budget impact analysis as well as the analysis of "cost-effectiveness" is fundamental in the modern system of pharmacoeconomics. Perhaps just a small number of published studies applying this method explained by the fact that the methodology and reporting of the results of budget impact analysis is in its infancy and needs further theoretical development, including in terms of health of the Russian Federation[5].

Analysis "cost-benefit" was applied only in 0.4% of the studies. Data on the use of the methods of pharmacoeconomic analysis are presented in figure (Fig.10).

Currently becoming more and more important sharing methods of analysis "cost-effectiveness" and "budget impact", which allows to conduct a more comprehensive economic assessment of new treatment methods at the stage of their implementation. The number of publications pharmacoeconomic studies that use only one of the methods is of 89.9%, two - 8.4%, is no exception to the use of three or more methods of 1.7%.

Some authors (17.6%), who published their study did not apply any methods of pharmacoeconomic analysis. It is also important to note that 5.7% of publications on pharmacoeconomic and clinical-economic was relevant methods such as ABC and VEN analysis, which are methods of pharmacoeconomic analysis. In some studies ABC and VEN analyses were combined with analysis of "cost-of-illness"

It is crucial to understand that the conduct of pharmacoeconomic and clinical-economic research, any of these methods of analysis, the author in

Fig. 10. Distribution methods of pharmacoeconomic analysis used in studies published on the basis of the scientific electronic library "eLIBRARY.RU" from 2005 to 2015.

the work should consider the price of the drug at the time of the study. Mapping and analysis of open publications on this issue revealed that 17.9 percent of the authors do not indicate the price of the drug, by publishing, in most cases, only the final data of the study.

Discussion

Database of the scientific electronic library "eLIBRARY.RU" has a tendency to continuously upgrade in the appearance of, for example, a new previously unpublished research. It is therefore necessary to consider that search was made as 01.09.2016.

Conclusions

Every year the number of pharmacoeconomic and clinical-economic research in the Russian Federation is growing steadily. Over the last ten years the number of publications increased by 4 times.

The leading directions in terms of pharmacoeconomic and clinical-economic analysis of new health technologies for the treatment of cardiovascular, pulmonary, oncological and endocrinological diseases.

According to published reports pharmacoeconomic and clinical-economic studies carried out in 52 subjects of the Russian Federation on the basis of 63 Universities. In addition to researchers from the Russian Federation on the platform of the scientific electronic library "eLIBRARY.RU" his research has placed the representatives from 11 countries.

As a result it was analyzed the work of more than 2,000 authors, among which were composed by screening and rating of researchers with the highest publication activity in the period from 2005 to 2015, and for the last three years in the period from 2012 to 2015 and scientometric rating according to the Russian science citation index due to the number of existing citations of works of the author with indication of the Hirsch-index. It is important to note that only one third of the published studies are generally cited.

Among the methods of pharmacoeconomic analysis of the most popular in published studies is the analysis of "cost-effectiveness", which is used in about 45% of the available studies.

Almost a fifth of the authors, when conducting a pharmacoeconomic and clinical economic analysis has not used any methods of pharmacoeconomic analysis in their study, however, carried it in the article title and key words.
